

Talking to Python

csev\$ python3

Python 3.5.1 (v3.5.1:37a07cee5969, Dec 5 2015, 21:12:44) [GCC 4.2.1 (Apple Inc. build 5666) (dot 3)] on darwinType "help", "copyright", "credits" or "license" for more information.

>>> What next?

```
csev$ python3
```

```
Python 3.5.1 (v3.5.1:37a07cee5969, Dec 5 2015, 21:12:44) [GCC 4.2.1 (Apple Inc. build 5666) (dot 3)] on darwinType "help", "copyright", "credits" or "license" for more information.
```

```
>>> x = 1
>>> print (x)
1
>>> x = x + 1
>>> print (x)
2
```

>>> exit()

This is a good test to make sure that you have Python correctly installed. Note that quit() also works to end the interactive session.

What Do We Say?

Elements of Python

- Vocabulary / Words Variables and Reserved words (Chapter 2)
- Sentence structure valid syntax patterns (Chapters 3-5)
- Story structure constructing a program for a purpose

```
name = input('Enter file:')
handle = open(name)
counts = dict()
for line in handle:
    words = line.split()
    for word in words:
        counts[word] = counts.get(word,0) + 1
bigcount = None
bigword = None
for word, count in counts.items():
    if bigcount is None or count > bigcount:
        bigword = word
        bigcount = count
print(bigword, bigcount)
```

A short "story" about how to count words in a file in Python

python words.py
Enter file: words.txt
to 16

Reserved Words

You cannot use reserved words as variable names / identifiers

False
None
True
and
as
assert
async

await
break
class
continue
def
del
elif

else
except
finally
for
from
global
if

import
in
is
lambda
nonlocal
not
or

pass raise return try while with yield

Sentences or Lines

x = 2

Assignment statement

x = x + 2

Assignment with expression

print(x)

Print function

Variable (e.g., x)

Operator (e.g., = +)

Constant Function (e.g., 2)

(e.g., print ())

Programming Paragraphs

Python Scripts

- Interactive Python is good for experiments and programs of 3-4 lines long.
- Most programs are much longer, so we type them into a file and tell Python to run the commands in the file.
- In a sense, we are "giving Python a script".
- As a convention, we add ".py" as the suffix on the end of these files to indicate they contain Python.

Interactive versus Script

- Interactive
 - You type directly to Python one line at a time and it responds
- Script
 - You enter a sequence of statements (lines) into a file using a text editor and tell Python to execute the statements in the file

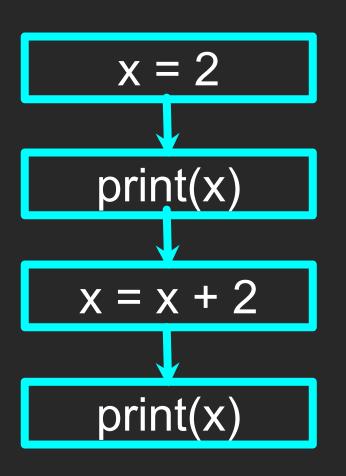

Program Steps or Program Flow

- Like a recipe or installation instructions, a program is a sequence of steps to be done in order.
- Some steps are conditional they may be skipped.
- Sometimes a step or group of steps is to be repeated.
- Sometimes we store a set of steps to be used over and over as needed several places throughout the program (Chapter 4).

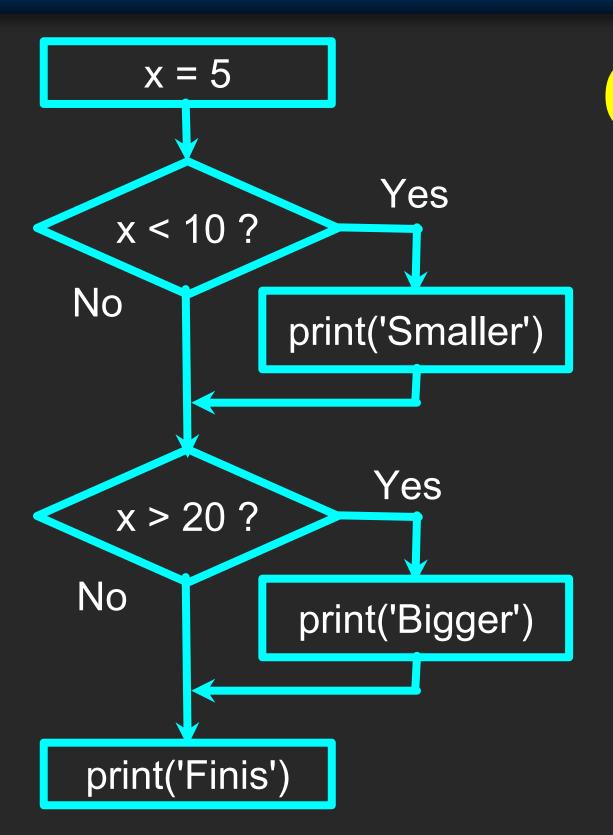

Sequential Steps

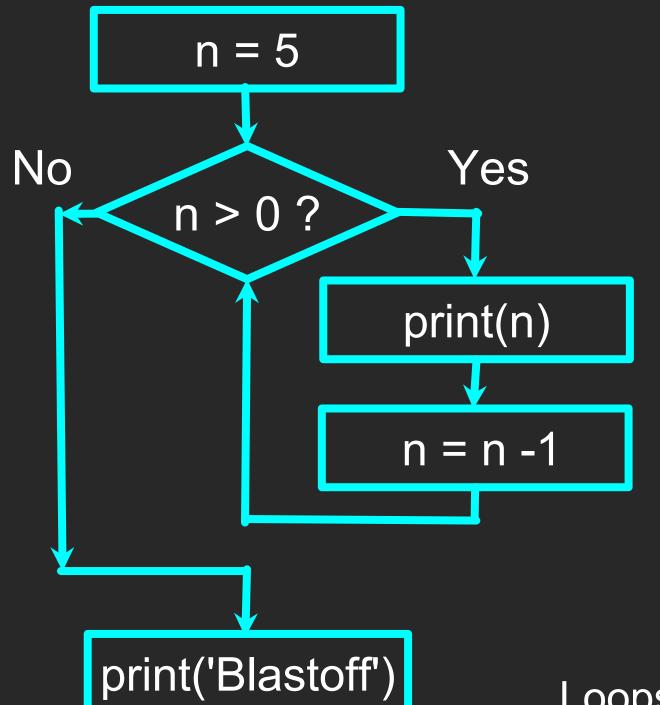

Program	Output
x = 2	
print(x)	2
x = x + 2	
print(x)	4

When a program is running, it flows from one step to the next. As programmers, we set up "paths" for the program to follow.

Conditional Steps

Program	Output
x = 5	
if x < 10:	Smaller
<pre>print('Smaller')</pre>	
if x > 20:	
<pre>print('Bigger')</pre>	
<pre>print('Finis')</pre>	Finis

Repeated Steps

Program	Output
n = 5	
while n > 0:	5
print(n)	4
n = n - 1	3
	2
	1
<pre>print('Blastoff!')</pre>	Blastoff!

Loops (repeated steps) have iteration variables that change each time through a loop.

```
Sequential
           name = input('Enter file:')
           handle = open(name)
           counts = dict()
Repeated
           for line in handle:
               words = line.split()
               for word in words:
                    counts[word] = counts.get(word,0) + 1
Sequential
           bigcount = None
           bigword = None
Repeated
           for word, count in counts.items():
Conditional
           if bigcount is None or count > bigcount:
                    bigword = word
                    bigcount = count
Sequential
           print(bigword, bigcount)
```

```
name = input('Enter file:')
handle = open(name, 'r')
counts = dict()
for line in handle:
    words = line.split()
    for word in words:
        counts[word] = counts.get(word,0) + 1
bigcount = None
bigword = None
for word, count in counts.items():
    if bigcount is None or count > bigcount:
        bigword = word
        bigcount = count
print(bigword, bigcount)
```

A short Python "Story" about how to count words in a file

A word used to read data from a user

A sentence about updating one of the many counts

A paragraph about how to find the largest item in a list

Summary

- This is a quick overview of Chapter 1
- We will revisit these concepts throughout the course
- Focus on the big picture
